

- \* Factors affecting the volume of production, The quantity of production depends upon the two factors as "Internal factors and External factors."
- \* Internal factors influencing quantity with efficiency of factors of production with combination of factors. It helps in finding good markets, better quality and help in enhancing their turnover with better combination of modern techniques, judicious mixing of factors.
- \* External factors like Natural resources vitally affect the quantity of production. It includes the land area, the quality of soil, forest wealth, minerals all affect the production capacity.
- \* Technological level - Technological improvement make use and machinery more efficient day-by-day. It make possible a great increasement in quality and quantity output.
- \* Credit and Banking facility - It provide us sufficient credit and capital to make more output. Banking facility make our

Business payment services easier -  
more capital availability help us to make  
more investment and output. vice versa.

\* Transportation and communication-

It helps us to collect raw materials,  
transport finished goods in the market for  
sale. maximum sale or demand of goods  
ask for more output or production of  
goods in large quantity. and less demand  
decrease quantity of production.

\* political conditions - The governmental policy  
of different government may differ for  
several industries. policy may influence,  
Bonds, support productions and industries.

Like the present government wants to produce  
more Solar energy so there are many  
supports available by the government.  
Dairy, msme, renewable energy etc.
